

## Image upload

- Single Image upload in laravel create view file. Name as image.blade.php save in project\_name/resources/view/image.blade.php.

```
<div class="col-md-3 form-group">
    <label>KYC Document Image</label>
    <input type="file" name="image" class="form-
control">
</div>
```

- Create upload folder in storage/public/app/upload
- In controller create function and write below code:

```
public function sales_store(Request $request){
    $path = $request->file('image')->storeAs(
        'upload', $request->file('image')->getClientOriginalName()
    );
    $img = explode('/', $path);
    $img_nm = $img[1];
    $sales = new Sales;
    $sales->image = $img_nm;
    $sales->save();
    return redirect('/salesdata');
}
```

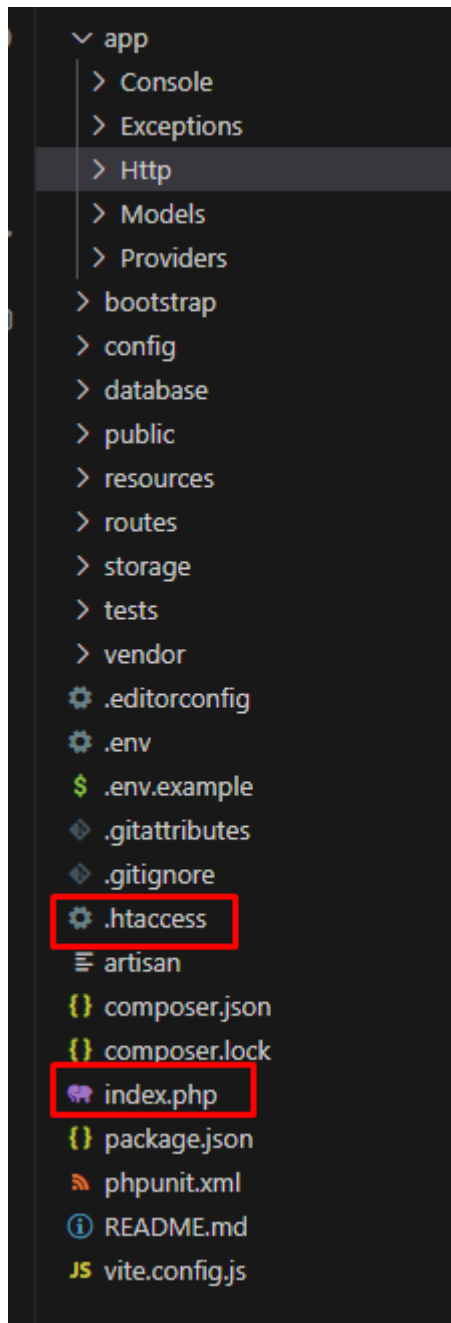

- When we upload image it store in folder and table also, but when we need to display that image it gives below url,

<http://localhost/myproject/public/storage/public/app/upload>

But our file is store on below path

<http://localhost/myproject/storage/public/app/upload>

- So,for that we need to change the settings. In our public folder .htaccess & index.php is available.
- We need to cut that folder from public folder and paste into our root folder.

- Open index.php file and remove ' /.. ' from every dir.

```
6
7  $app = require_once __DIR__.'../bootstrap/app.php';
8
```

After it looks like as,

```
$app = require_once __DIR__.'/bootstrap/app.php';
```

Now image is display on panel.

- Multiple Image upload in laravel create view file. Name as image.blade.php save in project\_name/resources/view/image.blade.php.

```
<div class="col-md-3 form-group">
    <label>KYC Document Image</label>
    <input type="file" name="image[]" class="form-control" multiple="multiple">
</div>
```

- Create upload folder in storage/public/app/upload
- In controller create function and write below code:

```
public function sales_store(Request $request){
    foreach ($request->file('image') as $imagefile) {
        $real_name = time().'-'.$imagefile->getClientOriginalName();
        $path[] = $imagefile->storeAs(
            'upload',$real_name);
    }
    $img = implode(',',$path);
    $sales = new Sales;
    $sales->image = $img;
    $sales->save();
    return redirect('/salesdata');
}
```

- That images are stores comma seperated in table, so when we need to display we have to explode that array then shows with there index value.

```
<tbody style="text-align:center;">
    @foreach($sales as $sale)
    <tr>
        <td>{{ $sale->id }}</td>
        <td>{{ $sale->name }}</td>
        <td>{{ $sale->sname }}</td>
        <td>{{ $sale->gender }}</td>
        @if($sale->kydoctype == '0')
            <td>Adhar Card</td>
        @elseif($sale->kydoctype == '1')
            <td>PAN Card</td>
        @else
            <td>License Card</td>
        @endif
        <td>{{ $sale->kycnumber }}</td>
        <td>
            <div class="table--media">
                
                
            </div>
        </td>
    </tr>
</tbody>
```
